

Gnosis VitalitY profile 'GVY7'

- **Full Blood Count**
- **Iron Status** (Iron, Transferrin, Transferrin Sat., TIBC)
- **Renal Function Tests**
- **Calcium**
- **Phosphate**
- **Magnesium**
- **Liver Function Tests**
- **Urine MicroAlb/Cre**
- **Lipids Profile** (Direct LDL if TG high)
- **Homocysteine**
- **Apo-B & Apo-A**
- **Hs-TnI** with Risk Stratification
- **High-Sensitive CRP**
- **Fasting Blood Sugar**
- **HbA1c**
- **Insulin & HOMA**
- **Vitamin D**
- **Vitamin B12**
- **Folate**
- **Superoxide Dismutase (SOD)**
- **Urine FEME**

Customized your package for each patient

PROMO RPP

RM556 RM720

Promotion until 30 Jun 2026

- E2
- Progesterone
- Testosterone
- SHFA: SHBG & FAI – when testosterone ordered
- LH
- FSH
- Prolactin
- FOB (Immuno method)
- Cystatin C
- Creatine Kinase
- Amylase
- Anti-Thyroid Peroxidase (ATPO)
- Anti-Thyroglobulin Ab (ATAB)
- Ferritin
- PTH
- TSH
- FT4
- FT3
- HBs Ag & HBs Ab
- HIV 1 & 2 (Ag & Ab)
- Anti-HAV
- H pylori Ig G
- TP Ab (reflex RPR)
- ABO & RH
- RFLD: RF & LDH
- Anti-CCP
- AFP
- CEA
- PSA
- CA 125
- CA15-3
- CA19-9
- EBV VCA Ig A
- Lipoprotein (a)

Superoxide Dismutase (SOD)

Superoxide dismutase (SOD) is one of the body's primary internal antioxidant defences, and plays a critical role in reducing the oxidative stress implicated in atherosclerosis and other life-threatening diseases.

SOD catalyses the dismutation of superoxide into oxygen O₂ and hydrogen peroxide H₂O₂.

Applications

- SOD deficiency is associated with diseases such as the Familial dominant form of amyotrophic lateral sclerosis (ALS) and Alzheimer's disease
- SOD can be used to treat various ailments including arthritis, burns and inflammatory diseases. Its measurement can help to evaluate the efficiency of treatment targeting SOD levels.

Apolipoprotein B / Apolipoprotein A1

provide a more accurate and comprehensive evaluation of cardiovascular risk than traditional lipid profiles.

ApoA1: The main protein in **HDL**, linked to cholesterol efflux and cardiovascular protection.

ApoB: The key structural protein of atherogenic lipoproteins (**LDL, IDL, VLDL**), strongly correlated with plaque formation.

ApoB/ApoA1 ratio is a superior predictor of atherosclerosis, making it invaluable for early risk assessment and personalized treatment strategies.

Apolipoproteins

Homocysteine

Elevated homocysteine levels are associated with an increased risk of cardiovascular diseases, including myocardial infarction and stroke.

It can also help identify deficiencies in Vitamin B6, B12, and folic acid, which are essential for homocysteine metabolism.
