

How Calprotectin Test Help in Your Practice?

GASTROINTESTINAL DISEASE

Test code : CALPR
Sample : Stool in sterile container
TAT : 3 working days
RPP Promo : **RM290** ~~RM360~~
Valid till 30 Jun 2026

What is Calprotectin?

Calprotectin is a calcium- and zinc-binding protein of the S-100 protein family which is mainly found within neutrophils and throughout the human body. The presence of calprotectin in faeces is a consequence of neutrophil migration into the gastrointestinal tissue due to an inflammatory process.¹

Clinical application?

- ✓ Assist in the diagnosis of intestinal inflammation and evaluate the degree of intestinal inflammation.
- ✓ Assist in the diagnosis of intestinal inflammation related diseases (inflammatory bowel disease, adenoma, colorectal cancer, etc)
- ✓ Differential diagnosis of inflammatory bowel disease (IBD) and irritable bowel syndrome (IBS)
- ✓ Prognostic assessment of intestinal inflammation related diseases.²

What is considered high?

Calprotectin levels	Interpretation
< 60 µg/g	Not indicative of inflammation.
60 - 200 µg/g	Can represent mild organic disease such as inflammation caused by nonsteroidal anti-inflammatory drugs (NSAIDs), mild diverticulitis and inflammatory bowel disease (IBD) in remission phase.
> 200 µg/g	Active organic disease with inflammation in the gastrointestinal tract. Appropriate further investigative and curative procedures by specialists are suggested.

What cancers cause high calprotectin?

Elevated levels can also occur in cases of gastrointestinal infections, peptic ulcers, colorectal cancer, and even due to the use of NSAIDs (nonsteroidal anti-inflammatory drugs).³
